Executive Summary As of June 30, 2020

Aggregate Plan Overview

The value of the San Jose Federated Retiree Health Care Trust's assets was \$307.4 million on June 30, 2020, an increase of \$30.3 million from the end of the prior quarter. The Trust had \$0.2 million of net cash inflows for the quarter.

- The Health Care Trust's net of fees performance was +11.0% for the quarter, compared to the Policy Benchmark return of +10.7%. Over the trailing one-year period, the Trust returned -0.1%, compared to +0.9% for the Policy Benchmark.
 - Growth returned +18.9% for the quarter and -2.0% over the trailing one-year period. Growth underperformed the Public Equity Benchmark by 50 basis points for the quarter and 320 basis points over the trailing one-year period.
 - Low Beta returned 0.0% for the quarter and +1.7% over the trailing one-year period, in-line with the ICE Bank of America Merrill Lynch 91 Days T-Bill TR benchmark over the quarter and outperforming by 10 basis points over the trailing one-year period.
 - Other returned +3.2% for the quarter and -1.0% over the trailing one-year period, outperforming the Other Benchmark by 250 basis points in the quarter and 360 basis points over the trailing one-year period.
- The Health Care Trust added one investment manager, Artisan Global Opportunities (Global Equity), during the quarter.

Manager Highlights

Artisan

• Artisan Global Value returned +15.7% for the quarter, outperforming the MSCI ACWI Value NR USD benchmark by 300 basis points. Compared to peers, Artisan ranks in the 73rd and 76th percentiles for the quarter and since inception periods, respectively.

Cove Street

• Cove Street Small Cap Value returned +21.1% for the quarter and -23.5% over the trailing one-year period, outperforming the Russell 2000 Value benchmark by 220 basis points for the quarter but underperforming by 600 basis points over the trailing one-year. Compared to peers, Cove Street ranks in the 48th and 69th percentiles for the quarter and since inception periods, respectively.

BlackRock

• BlackRock Core Property Fund returned -0.6% for the quarter, outperforming the NCREIF ODCE Equal Weighted benchmark by 90 basis points. Since inception in February 2019, BlackRock has outperformed the benchmark by 160 basis points.

Credit Suisse

• Credit Suisse Risk Parity Commodity Fund returned +12.1% for the quarter and -8.2% over the trailing one-year period, outperforming the Bloomberg Commodity Index by 700 and 920 basis points over the same time periods, respectively. Since inception in August 2011, Credit Suisse has outperformed the index by 400 basis points per year, on average.

Second Quarter Manager Summary

| Investment Manager | Asset Class | Changes/ Announcements | Meketa Recommendation ¹ | Comments |
|-----------------------------|---------------|---------------------------|---------------------------------------|------------|
| Artisan Global Value | Global Equity | | Hold | Watch List |
| Cove Street Small Cap Value | US Equity | | Hold | Watch List |
| Credit Suisse Risk Parity | Commodities | | | |

¹ The Meketa Investment Group recommendations are based on organizational or resource changes at each manager.

Watch List

Watch List^{1,2}

| Investment Manager | Asset Class | Watch List Status | Comments |
|-----------------------------|-------------|-------------------|------------------|
| Artisan Global Value | US Equity | Monitoring | Underperformance |
| Cove Street Small Cap Value | US Equity | Monitoring | Underperformance |

Artisan

• Over the three-year period, Artisan (-1.2%) has underperformed the MSCI ACWI Value by 20 basis points. Since inception in June 2015, Artisan has outperformed the benchmark by 90 basis points per year, on average, and ranked in the 76th percentile compared to peers.

Cove Street

• Over the three-year period, Cover Street (-4.7%) has underperformed the Russell 2000 Value by 40 basis points. Since inception in June 2015, Cove Street has underperformed the benchmark by 130 basis points per year, on average, and ranked in the 69th percentile compared to peers.

¹ Watch List excludes Private Markets and Passive Funds.

² Placement on the Watch List includes qualitative reasons and manager underperformance versus the appropriate benchmark over a three and or five year period as outlined in the Investment Policy Statement.

Glossary and Notes

Credit Risk: Refers to the risk that the issuer of a fixed income security may default (i.e., the issuer will be unable to make timely principal and/or interest payments on the security.)

Duration: Measure of the sensitivity of the price of a bond to a change in its yield to maturity. Duration summarizes, in a single number, the characteristics that cause bond prices to change in response to a change in interest rates. For example, the price of a bond with a duration of three years will rise by approximately 3% for each 1% decrease in its yield to maturity. Conversely, the price will decrease 3% for each 1% increase in the bond's yield. Price changes for two different bonds can be compared using duration. A bond with a duration of six years will exhibit twice the percentage price change of a bond with a three-year duration. The actual calculation of a bond's duration is somewhat complicated, but the idea behind the calculation is straightforward. The first step is to measure the time interval until receipt for each cash flow (coupon and principal payments) from a bond. The second step is to compute a weighted average of these time intervals. Each time interval is measured by the present value of that cash flow. This weighted average is the duration of the bond measured in years.

Information Ratio: This statistic is a measure of the consistency of a portfolio's performance relative to a benchmark. It is calculated by subtracting the benchmark return from the portfolio return (excess return), and dividing the resulting excess return by the standard deviation (volatility) of this excess return. A positive information ratio indicates outperformance versus the benchmark, and the higher the information ratio, the more consistent the outperformance.

Jensen's Alpha: A measure of the average return of a portfolio or investment in excess of what is predicted by its beta or "market" risk. Portfolio Return- [Risk Free Rate+Beta*(market return-Risk Free Rate)].

Market Capitalization: For a firm, market capitalization is the total market value of outstanding common stock. For a portfolio, market capitalization is the sum of the capitalization of each company weighted by the ratio of holdings in that company to total portfolio holdings; thus it is a weighted-average capitalization. Meketa Investment Group considers the largest 65% of the broad domestic equity market as large capitalization, the next 25% of the market as medium capitalization, and the smallest 10% of stocks as small capitalization.

Market Weighted: Stocks in many indices are weighted based on the total market capitalization of the issue. Thus, the individual returns of higher market-capitalization issues will more heavily influence an index's return than the returns of the smaller market-capitalization issues in the index.

Maturity: The date on which a loan, bond, mortgage, or other debt/security becomes due and is to be paid off.

Prepayment Risk: The risk that prepayments will increase (homeowners will prepay all or part of their mortgage) when mortgage interest rates decline; hence, investors' monies will be returned to them in a lower interest rate environment. Also, the risk that prepayments will slow down when mortgage interest rates rise; hence, investors will not have as much money as previously anticipated in a higher interest rate environment. A prepayment is any payment in excess of the scheduled mortgage payment.

Price-Book Value (P/B) Ratio: The current market price of a stock divided by its book value per share. Meketa Investment Group calculates P/B as the current price divided by Compustat's quarterly common equity. Common equity includes common stock, capital surplus, retained earnings, and treasury stock adjusted for both common and nonredeemable preferred stock. Similar to high P/E stocks, stocks with high P/B's tend to be riskier investments.

Price-Earnings (P/E) Ratio: A stock's market price divided by its current or estimated future earnings. Lower P/E ratios often characterize stocks in low growth or mature industries, stocks in groups that have fallen out of favor, or stocks of established blue chip companies with long records of stable earnings and regular dividends. Sometimes a company that has good fundamentals may be viewed unfavorably by the market if it is an industry that is temporarily out of favor. Or a business may have experienced financial problems causing investors to be skeptical about is future. Either of these situations would result in lower relative P/E ratios. Some stocks exhibit above-average sales and earnings growth or expectations for above average growth. Consequently, investors are willing to pay more for these companies' earnings, which results in elevated P/E ratios. In other words, investors will pay more for shares of companies whose profits, in their opinion, are expected to increase faster than average. Because future events are in no way assured, high P/E stocks tend to be riskier and more volatile investments. Meketa Investment Group calculates P/E as the current price divided by the I/B/E/S consensus of twelve-month forecast earnings per share.

Quality Rating: The rank assigned a security by such rating services as Fitch, Moody's, and Standard & Poor's. The rating may be determined by such factors as (1) the likelihood of fulfillment of dividend, income, and principal payment of obligations; (2) the nature and provisions of the issue; and (3) the security's relative position in the event of liquidation of the company. Bonds assigned the top four grades (AAA, AA, A, BBB) are considered investment grade because they are eligible bank investments as determined by the controller of the currency.

Sharpe Ratio: A commonly used measure of risk-adjusted return. It is calculated by subtracting the risk free return (usually three-month Treasury bill) from the portfolio return and dividing the resulting excess return by the portfolio's total risk level (standard deviation). The result is a measure of return per unit of total risk taken. The higher the Sharpe ratio, the better the fund's historical risk adjusted performance.

STIF Account: Short-term investment fund at a custodian bank that invests in cash-equivalent instruments. It is generally used to safely invest the excess cash held by portfolio managers.

Standard Deviation: A measure of the total risk of an asset or a portfolio. Standard deviation measures the dispersion of a set of numbers around a central point (e.g., the average return). If the standard deviation is small, the distribution is concentrated within a narrow range of values. For a normal distribution, about two thirds of the observations will fall within one standard deviation of the mean, and 95% of the observations will fall within two standard deviations of the mean.

Style: The description of the type of approach and strategy utilized by an investment manager to manage funds. For example, the style for equities is determined by portfolio characteristics such as price-to-book value, price-to-earnings ratio, and dividend yield. Equity styles include growth, value, and core.

Tracking Error: A divergence between the price behavior of a position or a portfolio and the price behavior of a benchmark, as defined by the difference in standard deviation.

Yield to Maturity: The yield, or return, provided by a bond to its maturity date; determined by a mathematical process, usually requiring the use of a "basis book." For example, a 5% bond pays \$5 a year interest on each \$100 par value. To figure its current yield, divide \$5 by \$95—the market price of the bond—and you get 5.26%. Assume that the same bond is due to mature in five years. On the maturity date, the issuer is pledged to pay \$100 for the bond that can be bought now for \$95. In other words, the bond is selling at a discount of 5% below par value. To figure yield to maturity, a simple and approximate method is to divide 5% by the five years to maturity, which equals 1% pro rata yearly. Add that 1% to the 5.26% current yield, and the yield to maturity is roughly 6.26%.

5% (discount)=1% pro rata, plus=6.26% (yield to maturity)5 (yrs. to maturity)5.26% (current yield)=6.26% (yield to maturity)

Yield to Worst: The lowest potential yield that can be received on a bond without the issuer actually defaulting. The yield to worst is calculated by making worst-case scenario assumptions on the issue by calculating the returns that would be received if provisions, including prepayment, call, or sinking fund, are used by the issuer.

NCREIF Property Index (NPI): Measures unleveraged investment performance of a very large pool of individual commercial real estate properties acquired in the private market by tax-exempt institutional investors for investment purposes only. The NPI index is capitalization-weighted for a quarterly time series composite total rate of return.

NCREIF Fund Index - Open End Diversified Core Equity (NFI-ODCE): Measures the investment performance of 28 open-end commingled funds pursuing a core investment strategy that reflects funds' leverage and cash positions. The NFI-ODCE index is equal-weighted and is reported gross and net of fees for a quarterly time series composite total rate of return.
